17. (currently amended) Use of the A method for providing a car interior with lining and fitting elements, said method comprising which comprises installing in said car interior a multilayer product which comprises a first element consisting of a layer of spongy, semi-rigid polymer (A), impregnated on one or both sides with polyurethane resin

(B), and inserted between two layers of glass fibre, natural fibre or a combination of glass fibre, and natural fibre (C) coupled with the central layer (B) (A) (B), wherein said first element is coupled with at least a second element comprising a layer of spongy, semi-rigid polymer (A), wherein said second element is impregnated on one or both sides with polyurethane resin (B), and wherein said second element is coupled with an additional layer of glass fibre, natural fibre or a combination of glass fibre and natural fibre (C) according to any of the previous claims, for the production of lining and fitting elements for car interiors.

19. (canceled)

20. (currently amended) A process for the processing of the multilayer product which comprises a first element consisting of a layer of spongy, semi-rigid polymer (A), impregnated on one or both sides with polyurethane resin (B), and inserted between two layers of glass fibre, natural fibre or a combination of glass fibre, and natural fibre (C) coupled with the central layer (B) (A) (B), wherein said first element is coupled with at least a second element comprising a layer of spongy, semi-rigid polymer (A), wherein said second element is impregnated on one or both sides with polyurethane resin (B), and wherein said second element is coupled with an additional layer of glass fibre, natural fibre or a combination of glass fibre and natural fibre (C) said process being characterized by the application of various pressure concentrations in different zones having different compression strength, flexibility and acoustic insulation properties.

21. (new) The process according to claim 17, comprising a (B) (A) (B) (C) (B) (A) (B) structure, wherein A, B and C have the meanings defined above, and optionally other elements consisting of the layers (A), (B) and (C) are added to the

outer sides of this structure, with the alternation specified above, with different alternations or with a combination of said alteration above and with different alterations.

22. (new) The process according to claim 17, wherein said spongy, semi-rigid polymer is selected from the group consisting of polyurethane, polystyrene and polyester.

23. (new) The process according to claim 17, wherein said spongy, semi-rigid polymer is polyurethane.

24. (new) The process according to claim 17, wherein said spongy, semi-rigid polymer is a polyurethane having a density ranging from 20 to 40 kg/m³.

25. (new) The process according to claim 17, wherein said spongy, semi-rigid polymer which forms layer (A) is the same polymer in all the (A) layers.

26. (new) The process according to claim 17, wherein said spongy, semi-rigid polymer which forms layer (A) is a polymer having different densities in the various (A) layers.

27. (new) The process according to claim 17, wherein said glass fibre is substituted by jute, sisal, coir or other equivalent natural materials.

28. (new) The process according to claim 17, comprising the coupling on both the outer sides of the coupled elements, of layers of light fabrics, covering vlies or a combination of layers of light fabric and covering vlies (D), obtaining a product with the structure
(D) (C) (B) (A) (B) (C) (B) (A) (B) (C) (D) .

29. (new) The process according to claim 17 wherein both external sides of said multilayer product or only one side

of said multilayer product comprises lining fabric or layers of anti-vibration material.

30. (new) The process according to claim 17, wherein the thickness of layer (A) varies from 4 to 18 mm.

31. (new) The process according to claim 17, wherein the thickness of layer (A) varies from 5 to 7 mm.

32. (new) The process according to claim 17, wherein the thickness of layer (A) is equal to 6 mm.

33. (new) The process according to claim 17, wherein the layers (A) of spongy, semi-rigid polymer have the same thickness.

34. (new) The process according to claim 17, wherein the layers (A) of spongy, semi-rigid polymer have different thicknesses.
